Genetic variability of hepatitis C virus in Western Siberia.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN A AND GLYCORROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MANA (BY SIMILARITY).

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN A MAD GLYCOPROFIEN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                             Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | SIDSI/ggdata/geneseq/geneseqp-embl/AA1981_DAT:

This invention describes a novel attenuated flavivirus live vaccine comprising a flavivius mutant that has a deletion of at least 4 consecutive amino acids from the capsid protein, provided that the capscutive amino acids from the capsid protein, provided that the creminal hydrophobic region is not affected by the deletion. The vaccine of the invention has virucide, antinflammatory and hepatotropic activity. The attenuated vaccine, and similar nucleic acid vaccines that encode the mutated capsid protein, are useful for protection against a vide range of flavivirus diseases, e.g. yellow fever, Japanese encephalitis, dengue, classical swine fever, bovine viral diarrhoea and hepatitis C. The specified deletion: (i) produces a reliably attenuated virus that does not revert to virulence; (ii) is exactly defined and does not effect immune responses to important proteins; and (iii) can not concert from contrarial virus by recombination. The mutant viruses eliminate the need to produce large amounts of infectious/virulent viruses, and can be produced with less expense. The protective response to flavivirus lasts significantly longer than that to killed vaccines. This sequence represents a fragment of the capsid protein from Heptitis c virus (HCV) type I described in the disclosure of the invention.
artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAY06073-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Attenuated flavivirus live vaccine, useful for protection against e.g. yellow fever, comprises virus with attenuating deletion of amino acids from the capsid protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Capsid protein; attenuated vaccine; virucide; antinflammatory; hepatotropic; yellow fever; Japanese encephalitis; dengue; classical swine fever; bovine viral diarrhoea; hepatitis C.

                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                 The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted rigation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosalc protein and the artificial mosalc protein are useful for detecting a hepatitis infection in an individual. The mosalc gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL; restriction endonuclease assisted ligation; vaccination.

Isolated CDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the CDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, Iymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA and amino acid sequence of HCV envelope 1 and core proteins used to determine HCV genotype and as vaccines against HCV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 134; DB 17; Length 191;

Isolated cDNA sequences are used for the prodn of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.

                                                                                                                                AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                               DNA and amino acid sequence of HCV envelope 1 and core proteins -used to determine HCV genotype and as vaccines against HCV infection

The sequences AAR96526-R96578 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-j, 5a and 6a. They esp. from the novel subtypes la-f, 2e-i, 2k, 2l, 3q-jk.m. and 6a. They esp. from the novel subtypes la-f, 2e-i, 2k, 2l, 3q-jk.m. and 6a. They esp. from the novel subtypes la-f, 2e-i, 2k, 2l, 3q-jk.m. and 2a-jk.m. and 10 m. sequence corresp. to the 5' untranslated region (UR), the Core/El, NS4 or NS5B regions of the genome. This sequence represents amino acids l-317 from the HCV types 7c and 8a isolates VN4.

The new HCV types were isolated from patients with chronic HCV from the Benelux countries, France, Cameroon and Vietnam, because of their abeniux countries, France, Tameroon and Vietnam, because of their abenium the countries of the NNA was extracted, cDNA synthesized and PCR amplified, cloned and genotyped. The 5'UR, Core-El and NSSB regions were sequenced either directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences can also be used to synthesize probes and primers for the sequences can also be used to synthesize probes and primers for the sequences can also be used to synthesize probes and primers for the catection of HCV in a sample. The polypeptides can be used to detect anti-HCV antibodies, for HCV typing or to prevent HCV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HCV; E1; envelope 1; core protein; HCV genotyping; antibody; vaccine;

CDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-B. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See AAQ40425-040439.
                                                cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-A. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See AAQ40425-Q40439.

                                                                                                                                                                                                                                                                                                                                                                                                       AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vactines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against effection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, and antigen specificity of enzyme spectrum of immunoreactivity, and antigen specificity of enzyme immunosasays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymerase chain reaction; PCR; amplify; primer; non-A, non-B hepatitis; NANBH; virus; blood transmissible; detection; hepatitis virus; RT-PCR; C100 antibody; HCV RNA; NS5 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                           New mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species - useful for detecting hepatitis infection in an individual

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-C. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV.

expression cassette including a first polynuclectide region including a 5 non-coding region (NFN) sequence of an RNA virus and at least an N-terminal portion of a coding sequence of RNA virus, a second polynuclectide region including a 3 untranslated region (UTR) sequence of RNA virus, an second as the RNA virus and at least a C-terminal portion of a coding sequence of the virus and a third polynuclectide region encoding a reporter molecule, flanked by first and second polynuclectide regions; and a molecule, flanked by first and second polynuclectide regions; and a moner so as to enable a transcription of a minus strand RNA molecule from the expression cassette in a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is resistance of an RNA virus. The present sequence is Hepatitis C virus (HCV) isolate HCV-SI full-length polyprotein.
non-B hepatitis (NANBH) virus. The cDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were C100 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on CDNA and the total human NANBH DNA was constructed from 23 clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and a promoter operably linked RNA transcription of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of an antigen used in a novel assay for determining anti-RCV antibody titre. A sample is diluted to an absorbance of not more than 2.0 and the peptide antigen is added. The method is useful for monitoring the effect of interferon treatment on anti-HCV antibody titres.

-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBITC, SUGGESTING A POSSIBLE MEMBRANE-RELEATED FUNCTION.

NS3 AND NS5 MAY FLAY A ROLE IN THE VIRAL RNA REFLICATION.

-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precision Polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (RNA)(N).
--- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
--- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                               3010 AA

I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN BAYBLOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-i- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPMCTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE-92230232; PubMed-1314459; Okado M., Lizuka H., Okada S.I., Yamamoto K., Lizuka H., Cokada S.I., Okada S.I., Tanaka T., Fukuda S., Tsuda F., Mishiro S., Full-length sequence of a hepertitis C virus genome having poor monology to reported isolates: comparative study of four distinct Virology 188:331-341(1992).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genotypes.;

Virology 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
- FUNCTION: THE SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCARSID COVERED BY LIPOPROTEIN MAND GLYCOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE-92230232; PubMed-1314459; Okamanoto K., Lizuka H., Cokamoto H., Kurai K., Okada S.I., Yamanoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S.; "Full-length sequence of a hepatitis C virus genome having poor homology to reported isolates: comparative study of four distinct
